INTRODUCTION

Bats (Chiroptera) represent a key group of mammals that play a crucial role in ecosystem functioning. They regulate insect populations, including agricultural pests, and serve as bioindicators of environmental health. In the context of intensifying human activities and increasing anthropogenic pressures, the conservation of bats becomes particularly important, especially in areas subject to large-scale construction projects, such as the new international airport near Tashkent.

International frameworks highlight the necessity of considering bats during the planning and implementation of infrastructure projects. The Convention on the Conservation of Migratory Species of Wild Animals (CMS) and the associated EUROBATS Agreement establish requirements for the protection of bat habitats and the prevention of adverse impacts on their populations. In addition, the guidance documents of the International Finance Corporation (IFC Performance Standard 6) and the European Bank for Reconstruction and Development (EBRD PR6) require due consideration of biodiversity conservation, including species that are threatened or of particular ecological importance.

The Site is located in the flat area between the Chirchik and Ahangaran rivers, on the left bank of the lower reaches of the Chirchik River, 7-8 km northeast of the district center of Yangiyul. According to the administrative-territorial division, the Project area is located on the territory of the Urtachirchik and Kuyichirchik districts of the Tashkent region.

This report presents the results of acoustic transect surveys of bats and roost searches conducted within the Project area and adjacent territories. The surveys were aimed at identifying species composition, assessing bat activity, and determining spatial distribution, which will support the evaluation of potential project impacts and the development of appropriate mitigation measures. The findings provide a scientific basis for conservation planning and for ensuring compliance with national and international biodiversity requirements.

2. MATERIALS AND METHODS

2.1 Sampling Methods

Study Area

The Project site is located approximately 6 km south of Tashkent. The climate of the region is continental, characterized by hot, arid summers and relatively cold winters. About 2 km to the northwest flows the Chirchik River, where fish-breeding ponds are situated. From the river, active irrigation canals branch off towards the Project area.

The territory of the Project has been significantly transformed by agricultural activities and is predominantly represented by farmland intersected by a network of dirt roads. Irrigation canals of varying widths cross the area, with some of their banks occupied by woody and shrubby vegetation. In the central part of the Project site, approximately 77.6 ha are covered by orchards, adjacent to which there are two relatively large artificial ponds (about 100 × 15 m), most likely used for irrigation purposes.

Figures 1, 2: Project area and vicinity

In the eastern and southern parts of the Site, as well as in close proximity to its boundaries, several small settlements are located. Within the Project area, there are also a number of isolated residential and farm buildings.

These features are of potential importance for bats. Artificial and natural waterbodies, irrigation canals, and other aquatic habitats provide sources of drinking water and attract concentrations of insects. Agricultural fields and patches of woody and shrubby vegetation serve as refuges for nocturnal insects, thereby playing an important role for bats as both foraging grounds and transit zones. Attics, cavities, and cracks in residential, agricultural, and abandoned buildings may serve as bat roosts, including both hibernation and maternity sites.

Acoustic Survey

Since one of the objectives of the study was to identify potential bat roosts, 14 key points which can be used as roosts with a high probability or be highly attractive as the water sources or foraging areas, were identified at the survey planning stage, four within the Project area and 10 within a 2 km buffer zone from the Project boundary. A total of 12 points were visited during the survey to record the bat calls near these features and inspect for the presence of any major active bat roosts. Two remaining points located in the central part of the site were fenced and therefore inaccessible (Refer Figure 33).

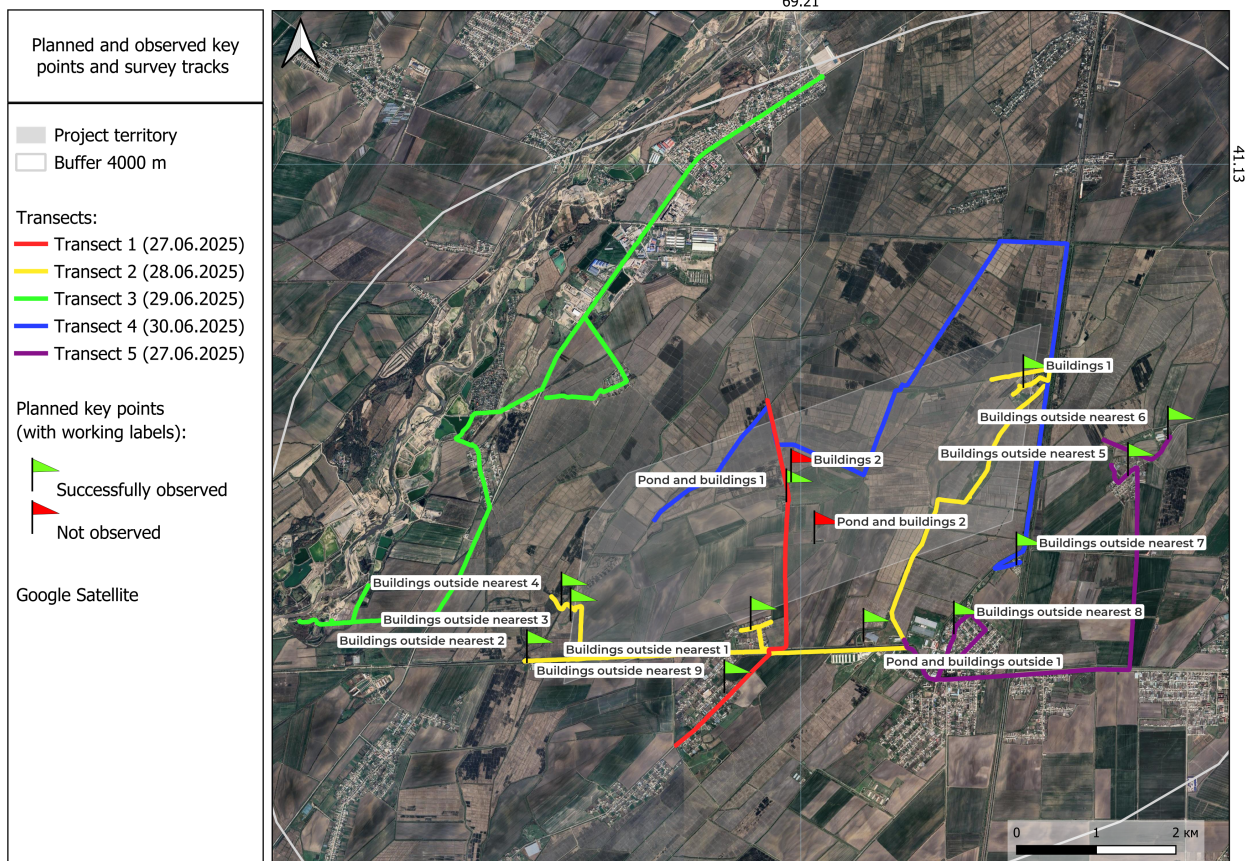

Figure 3: Planned and Visited (Green Flags) Key Points with Survey Tracks for the Entire Survey Period

The vehicle transect routes were laid along roads, primarily within the central zone of the planned airport development, with partial coverage of adjacent areas. The transects included potential roosting areas (various buildings and tree stands) as well as different habitat types, such as foraging grounds (waterbodies, fields, and orchards). Transects 1–2 and 4 are mainly laid out within the project site and its adjacent territory, while Transect 3 runs along the Chirchik River, and Transect 5 covers the south-eastern adjacent territory, including two settlements.

In total, five transects were established, ranging in length from 5.4 to 7.7 km and comprising between 12 and 29 survey points each. The distance between points was approximately 500 m, with a recording time of 4 minutes at each point (Figure 44).

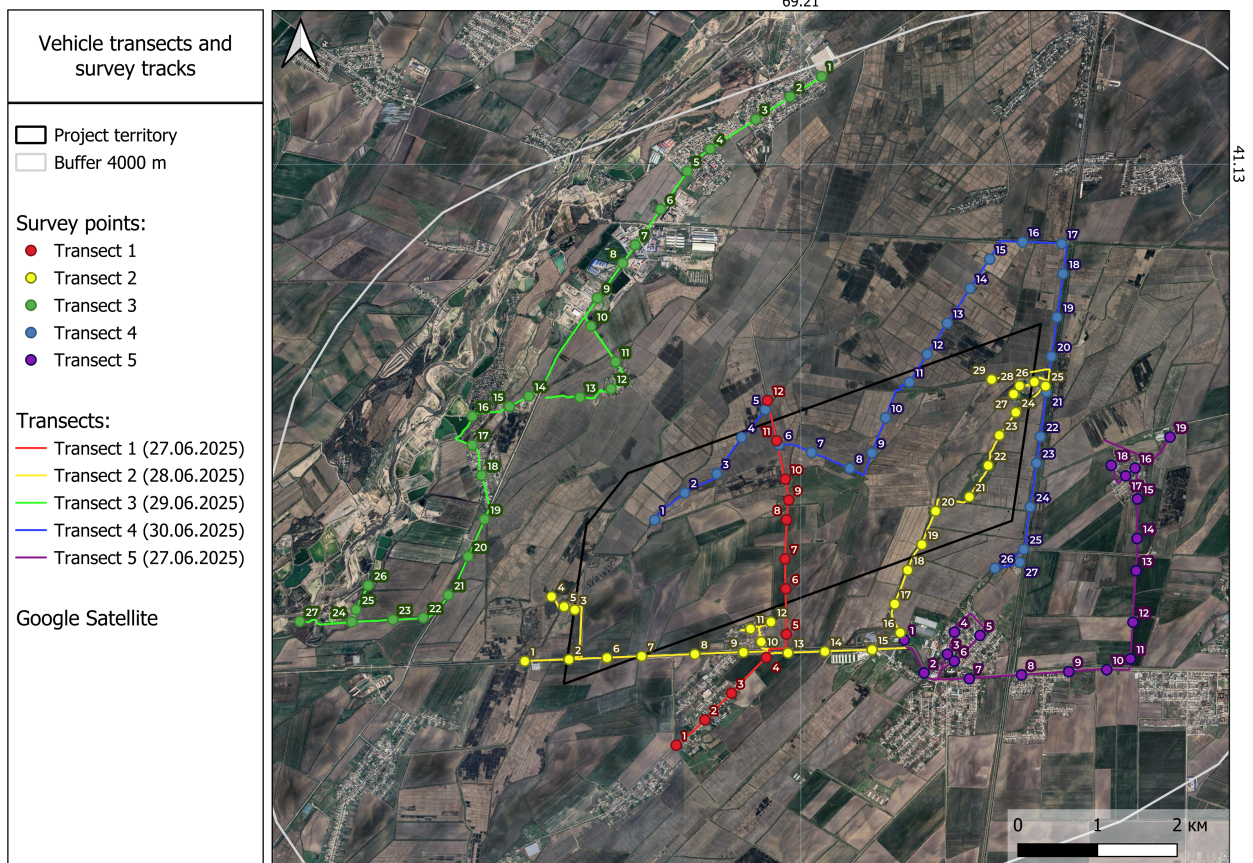

Figure 4: Vehicle Transects and Survey Points

On the first evening, data were collected along two transects, while on the following days one transect was surveyed per night. In total, 114 survey points were covered, resulting in 456 minutes of point recordings and 62.9 km of transect routes (Table 1). More detailed information is provided in the Attachment section.

Table 1: Total Efforts and Sampling Details

Transect N°:	Transect 1	Transect 2	Transect 3	Transect 4	Transect 5	Total
Date	27.06.2025	28.06.2025	29.06.2025	30.06.2025	27.06.2025	4 days
Start	22:47	20:36	20:32	21:05	20:32	—
End	00:00	00:20	23:38	00:23	22:26	—
Number of survey points	12	29	27	27	19	114
A total time at points (minutes)	48	116	108	108	76	456
Length (km)	5.4	16.3	17.7	13.5	10.1	62.9
Recording time for all survey (minutes)	73	224	186	198	230	911

The survey was conducted under favourable weather conditions, within four hours after the onset of nautical twilight, when bat activity typically reaches its daily peak. During the recordings, the vehicle engine, air conditioning, and other potential sources of disturbance were switched off.

An ultrasonic detector Bat Logger M2 was used, positioned at a 45° angle towards the sky to ensure optimal detection of bat echolocation signals (Figure 55– a). In addition, recordings were continued

while driving between survey points; these data were also taken into account and are presented in the **Results** section.

a)

b)

Figure 5: a) – Process of Recording Using the Ultrasonic Bat Detector Bat Logger M2; b) – Locked Gates Near the Point “Pond and Buildings 2”

Limitations

Bat roost surveys were not conducted in residential buildings and human-made structures located within or in close proximity to the project area, as surveying multiple households would have inevitably led to the disclosure of sensitive project information and triggered premature public discussion. Consequently, visual inspections of buildings for roosting sites were replaced with active, vehicle-based transect surveys using ultrasonic bat call recording equipment.

2.2 Bat Calls Identification

Literature Overview

The desk-based work consisted of two components: a review of the available literature with the compilation of a list of potential species inhabiting the area, and the analysis and processing of the collected field data.

Unfortunately, the chiropteran fauna of Central Asia, and Uzbekistan in particular, remains relatively poorly studied. The most comprehensive investigations in Uzbekistan were carried out during the Soviet period, while in recent decades only a few papers have been published, mostly focusing on mountainous or desert regions of the country. For the preparation of this report, the works of O. Bogdanov (1953), A. Kuzyakin (1950), M. Gritsyna (2013), and S. Kruskop (2025) were referred, along with species distribution data presented in the IUCN Red List portal and unpublished records from the author's own observations.

For echolocation call identification, reference works by J. Russ (2021) and M. Barataud (2019) were used.

Data Analysis

The process of analysing recordings and identifying species was carried out in two stages using the Kaleidoscope Pro software. At the first stage, sorting and separating bat calls from noise was performed using the Classifier (Neutral) tool with recognition of species inhabiting Uzbekistan, and Auto-ID statuses were obtained. Afterwards, all recordings, including noise files, were manually reviewed and identified. In some files classified by the algorithm as noise, bat calls were found, while certain ultrasonic signals identified by the algorithm as bat calls (mainly *Nyctalus noctula*) turned out to be mechanical noise.

The "Noise files" category includes any files in which no bat calls were detected. Recordings containing calls of more than one species were counted for each of them. Recordings in which signals of more than one individual of the same species were registered were classified as recordings containing a single signal.

Since echolocation signals of different species may overlap, it is often impossible to identify a signal to species level. In such cases, experts identify signals to genus or species group level. In this study, all signals were identified to species level, as their characteristics fit quite well into the accepted parameters. However, given the variability and overlap of echolocation signal parameters among different species, the possibility of error within a species group remains.

Since different bat species have varying echolocation ranges, the Correction Factor (Dietz, 2016) is used for relative analysis of the "species ratio" within 25 m from the recording device. In this report, the primary focus is on actual data without adjustment for detection distance; however, in Table 4, data corrected for detection range are also provided in order to give a more balanced assessment.

Table 2: Main Characteristics of Acoustic Identification of the Recorded Species, Their Groups, and Correction Factor

Species	Correction factor	Group of species	Comments
David's myotis	2.5	Myotis	David's myotis has a longer inter-pulse interval than Geoffroy's bat. Its frequency of maximum energy is also on average slightly lower. However, since signal characteristics may vary for a number of reasons, we acknowledge the possibility
Geoffroy's bat	2.5		

			of error at the group level. Other <i>Myotis</i> species with similar echolocation signals are absent from this region.
Eastern Barbastelle	1.7	Barbastelle	The <i>Barbastella</i> genus is characterised by a distinctive call consisting of two elements with a concave shape. The recorded signal most likely belongs to the Eastern barbastelle.
Common pipistrelle	0.83	Pipistrelle	Identification is considered reliable, as no other species of this genus are present.
Serotine bat	0.71	Vespertilio/Eptesicus	On average, the inter-pulse interval in the Serotine bat is shorter, and the frequency of maximum energy may reach higher values compared to the Parti-coloured bat. However, since signal characteristics may vary for a number of reasons, we acknowledge the possibility of error at the group level.
Parti-coloured bat	0.5		

3. RESULTS

3.1 Desktop Data Results

Based on current literature and expert data, the bat fauna of Uzbekistan comprises 19–21 species, of which 12–13 species are considered more or less likely to inhabit or occasionally occur within the Project area.

The table below presents species that occupy similar habitats, together with available records of their occurrence in Tashkent or its vicinity.

Table 3. Bat Species Potentially Occurring within the Project Area, their Conservation Status, Roosting Habits, and Records near Tashkent

SN	Common name	Latin name	IUCN status ¹	Uzbekistan Red Data Book status	Roost in buildings/trees	Previously observed near Tashkent
1	Greater horseshoe bat	<i>Rhinolophus ferrumequinum</i>	LC:D		+	+
2	Bokhara horseshoe bat	<i>Rhinolophus bocharicus</i>	LC:S		Rare	+
3	Lesser horseshoe bat	<i>Rhinolophus hipposideros</i>	LC:D	VU:D	+	-
4	Kyrgyz horseshoe bat	<i>Rhinolophus kirghisorum</i>	—		Abandoned houses only	-
5	Lesser mouse-eared bat	<i>Myotis blythii</i>	LC:D		+	+
6	Geoffroy's bat	<i>Myotis emarginatus</i>	LC:S		+	+
7	David's myotis	<i>Myotis davidii</i>	LC:U		+	+
8	Arabian barbastelle	<i>Barbastella leucomelas</i>	LC:U		-?	+
9	Noctule Bat	<i>Nyctalus noctula</i>	LC:U		+	+
10	Common Pipistrelle	<i>Pipistrellus pipistrellus</i>	LC:S		+	+
11	Parti-coloured bat	<i>Vespertilio murinus</i>	LC:S		+	+
12	Ognev's Serotine	<i>Eptesicus ognevi</i>	LC:U		+	-

¹ Category: LC – least concern, VU – vulnerable; Population trend: S – stable, D – decreasing, U – unknown

SN	Common name	Latin name	IUCN status ¹	Uzbekistan Red Data Book status	Roost in buildings/ trees	Previously observed near Tashkent
13	Serotine bat	<i>Eptesicus serotinus</i>	LC:S		+	+

3.2 Baseline Survey Results

Over four nights, 456 minutes of recordings were made at 114 survey points, with an additional 455 minutes obtained while moving between the points. In total, 3,051 raw material files (26 GB) collected, of which 1,815 files containing bat calls identified after both automated and manual sorting. Of these, 1,278 files recorded at survey points, 537 while moving between points, and 30 files contained calls of two bat species, one of which was the Common pipistrelle (*Pipistrellus pipistrellus*). Bats were recorded at 111 out of 114 survey points, with the exception of point 1 on transect 3, point 2 on transect 2, and point 2 on transect 5.

The acoustic analysis identified six species belonging to five genera. None of the recorded species are listed in the Red Data Book of the Republic of Uzbekistan or in the IUCN Red List with a status of NT or higher. However, all species are included in Appendix II of the Convention on the Conservation of Migratory Species of Wild Animals (CMS) and in the EUROBATs Agreement. Although Uzbekistan is not a Party to the EUROBATs Agreement, its standards and guidelines are considered international best practice and therefore were taken into account in this assessment. In addition, the Eastern barbastelle (*Barbastella caspica*) is a rare and apparently declining species, and its inclusion in the forthcoming edition of the National Red Data Book is under discussion.

Table 4: Bat Species Recorded

Common name	Latin name	IUCN Red List	Red Data Book of Uzbekistan	CMS	Number of recorded files contained bat calls	Correction-adjusted number of bat call files (within 25 m)	Transects
David's myotis	<i>Myotis davidii</i>	LC: Unknown	Not listed	Appendix II, EUROBATs	19	47.5	Transects: 2-5
Geoffroy's bat	<i>Myotis emarginatus</i>	LC: Stable	Not listed	Appendix II, EUROBATs	21	52.5	Transects: 1, 2, 4, 5
Eastern Barbastelle	<i>Barbastella caspica</i>	LC: Unknown	Not listed	Appendix II, EUROBATs	1	1.7	Transect 3
Common pipistrelle	<i>Pipistrellus pipistrellus</i>	LC: Stable	Not listed	Appendix II,	1761	1461.6	Transects 1-5

				EUROBAT S			
Serotine bat	<i>Eptesicus serotinus</i>	LC: Stable	Not listed	Appendix II, EUROBAT S	24	17.9	Transects 1-5
Parti-coloured bat	<i>Vespertilio murinus</i>	LC: Stable	Not listed	Appendix II, EUROBAT S	5	2.5	Transects 1-3, 5

According to the data for all species obtained during the survey, bats are widely represented within the Project area. Although 96% of all recorded files belong to the Common pipistrelle, other bat species, with the exception of the Eastern barbastelle, were also repeatedly recorded.

Table 5: Comparison of Bat Activity on Different Transects

	Transect 1 and 5	Transect 1	Transect 2	Transect 3	Transect 4	Transect 5
Total number of bat call files	331	103	378	204	365	228
Number of survey points	31	12	29	27	27	19
Mean bat call files per survey point (4 min)	10.7	8.6	13.0	7.6	13.5	12.0
Bat passes per hour (Activity index)	160.2	128.8	195.5	113.3	202.8	180.0

For comparing bat activity across transects, the Bat Index – the average number of bat passes per hour – was used. Since transects 1 and 5 were conducted on the first survey night, they were combined for comparative analysis in order to neutralize temporal differences in activity.

The lowest activity was recorded along transect 3, which runs along the Chirchik River, while the highest was observed on transect 4, covering the northern part of the project area and the eastern part of the adjacent territory. Transect 2, running across the southern and south-eastern sections of the survey area, showed slightly lower values.

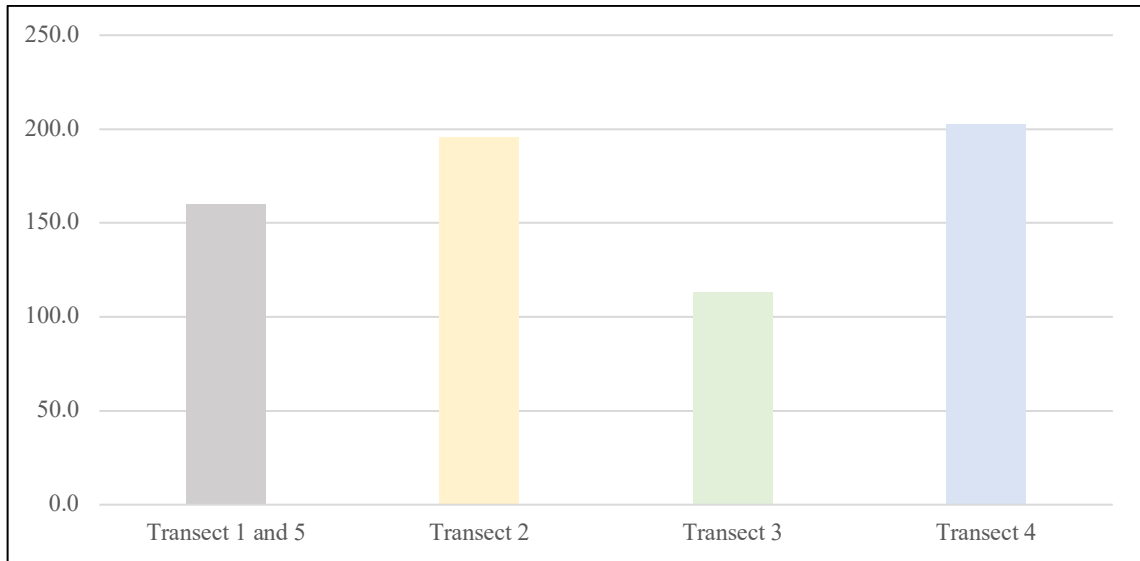

Figure 6: Bat Passes per Hour

The most abundant species across all five transects was the Common pipistrelle (*Pipistrellus pipistrellus*) (IUCN LC). Its calls were recorded 1,761 times, and the species was detected at nearly all survey points, with up to 45 calls registered within a four-minute period at some locations. The highest activity of this species was observed within settlements, in the area of the old runway in the eastern part of the Project territory, and near water bodies.

The second most abundant species was the Serotine bat (*Eptesicus serotinus*) (IUCN LC). It was also recorded along all transects but with a much lower number of detections (24 in total). This species was mainly recorded in agricultural fields or industrial areas, with only two detections in settlements.

The Parti-coloured bat (*Vespertilio murinus*) (IUCN LC), which produces echolocation signals similar to those of the Serotine bat, was recorded five times at four points. Two detections were made in settlements, and the other two in agricultural fields.

The Eastern barbastelle (*Barbastella caspica*) (IUCN LC) was recorded once, near a mining area west of the project territory.

David's myotis (*Myotis davidii*) and Geoffroy's bat (*Myotis emarginatus*) (Both IUCN LC) were recorded 19 and 21 times respectively. Most detections were made in fields near irrigation canals and/or shrub vegetation, although several records were also obtained within settlements.

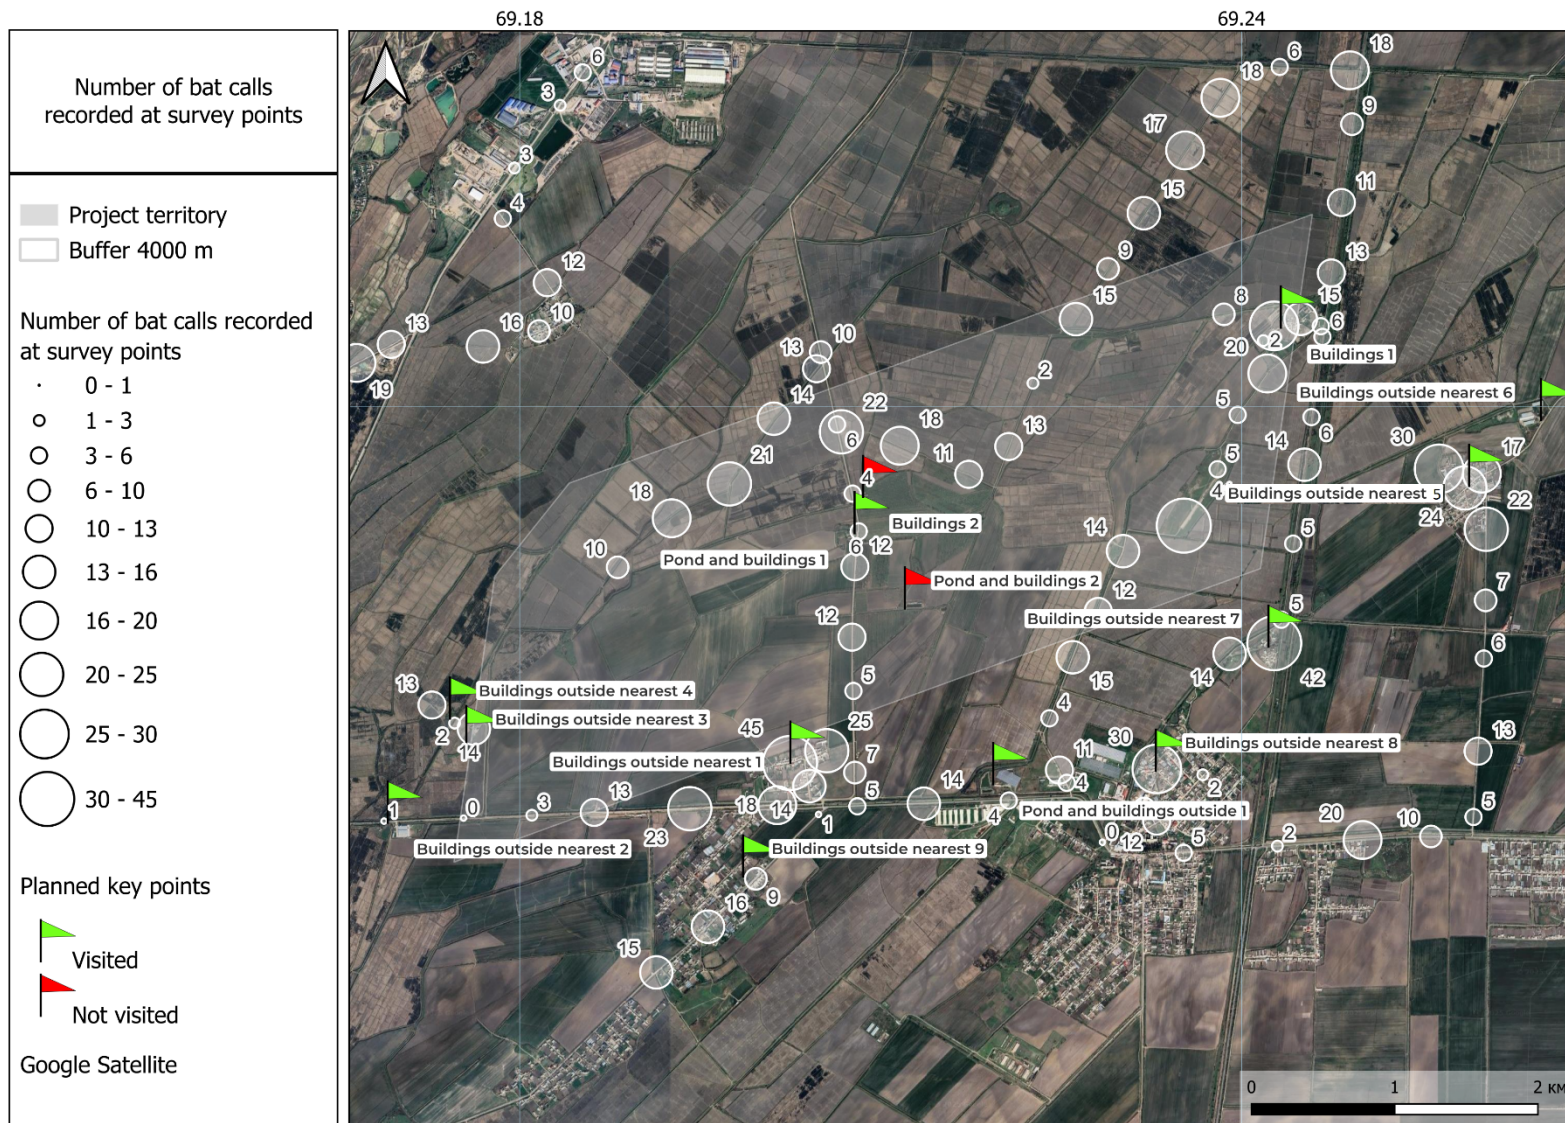

Figure 12. Proportional Symbol Map Showing the Number of Bat Calls Recorded at Survey Points and the Planned Key Points

3.3 Species Accounts (Based on Kruskop, 2021)

David's myotis (*Myotis davidii*)

A small bat with a body weight of 4.5–7 g and a wingspan of about 20 cm. It inhabits various, mainly arid, landscapes ranging from the southern forest zone to semi-deserts, usually associated with open habitats, including anthropogenic ones. Roosts are generally located in crevices of buildings, rock fissures, and caves, and in the forest zone also in tree hollows. It emerges to forage shortly after dusk. Prey consists of flying insects hunted at low altitudes above the ground. The flight is fairly fast and maneuverable. The species is sedentary or undertakes only minor seasonal movements. It hibernates in a variety of underground shelters. Reproduction takes place in early to mid-summer; maternity colonies comprise up to several dozen females, while males usually remain solitary. A single young is born per litter.

Figure 13²: *Myotis davidii*

Geoffroy's bat (*Myotis emarginatus*)

A small bat with a body weight of 5–10 g and a wingspan of 22–28 cm. It prefers open, particularly arid, landscapes. Roosts are generally found in caves, grottoes, and attics of large buildings, and it often forms mixed colonies with horseshoe bats. The species emerges at dusk and forages at low altitudes along forest belts, hedges, and within dense vegetation. It captures insects both in flight and from the surface of leaves. The flight is slow but highly maneuverable. The species is sedentary, overwintering in a variety of underground shelters.

² All illustrative photos of species for reference only (not taken at the Project site)

Figure 14: *Myotis emarginatus*

Eastern barbastelle (*Barbastella capsica*)

The species inhabits foothill and mountain areas in arid and semi-arid regions, occurring at elevations up to 2,500 m above sea level. Typical roosts include adits, caves, ruins, and rock crevices. It emerges at dusk and forages for flying insects at low altitudes. Bogdanov reported several records of the Eastern barbastelle near Tashkent in the last century.

Figure 15: *Barbastella caspica*

Common pipistrelle (*Pipistrellus pipistrellus*)

Weight: 4–8 g. The species inhabits a variety of landscapes but shows a preference for anthropogenic environments and is frequently found in human settlements, including urban areas. It typically roosts in buildings, less commonly in tree hollows or other crevice-like shelters, often sharing sites with other bat species. Emergence occurs in early twilight. Foraging takes place at low altitudes above forest edges, clearings, alleys, and streets, where it hunts small flying insects. The flight is fast and highly maneuverable.

Figure 16: *Pipistrellus pipistrellus*

Serotine bat (*Eptesicus serotinus*)

Weight 15-30 g, Lives in various, mainly anthropogenic, landscapes. Usually settles in human buildings, less often - in rock cracks. Flies out to hunt in thick twilight. Flight is slow, calm, but maneuverable. Catches insects both in the air, sometimes at a very high altitude, and on the substrate. Lives up to 19 years.

Figure 17: *Eptesicus serotinus*

Parti-coloured bat (*Vespertilio murinus*)

Occurs in a wide range of landscapes, including anthropogenic environments, and is found in mountains up to 3,000 m a.s.l. Roosts are located in human-made structures and tree hollows. It emerges to forage in early twilight, typically hunting flying insects at higher altitudes over open areas, less frequently above forests or water bodies. Seasonal migrations of up to 1,300 km are known, although in many regions the species is sedentary. Winter roosts are usually in human-made structures, less commonly in underground shelters.

Figure 18: *Vespertilio murinus*

4. DISCUSSION

The obtained data indicate a relatively high occurrence of bats, as they were recorded at nearly all survey points. The substantial number of detections at each point suggests that the territory is used not only as a transit area but also as a foraging ground and, likely, as a habitat for several species.

Among the six recorded bat species, five are associated with anthropogenic structures, and three of them are known to use trees as roosting sites. Despite the presence of migratory species such as the Parti-coloured bat (*Vespertilio murinus*), which is also capable of residing in relatively small areas, the majority of species recorded are sedentary and are highly likely to inhabit nearby buildings and tree holes. This highlights the strong dependence of the local bat community on the availability of both anthropogenic and natural habitats.

Most survey points with high levels of activity (20-45 recordings per session) were concentrated in areas of increased attractiveness for bats, near water bodies, within settlements, and on well-heated sites such as the old runway in the eastern part of the Project territory. These habitats appear to play a key role in providing foraging opportunities and favourable conditions for bats.

At most of the sampling points identified, bat activity was higher, with the highest number of recordings obtained near groups of buildings. For example, in the southern and north-eastern parts of the Project Area, the number of bat call recordings reached 28–45, indicating the use of buildings as roosting sites by bats. In contrast, the central part of the area showed a lower number of bat call recordings, which may be related to a wider spatial distribution of bats across foraging habitats (**Figure 12**).

Contrary to initial expectations of increased activity near the Chirchik River, the transect 3 produced the lowest number of bat records. A plausible explanation is that the foraging habitat in this area is considerably larger, leading to a wider spatial distribution of individuals rather than a concentration along the surveyed left bank. Alternative factors may also account for this pattern, including higher insect availability in agricultural landscapes and village surroundings, the presence of warmer microhabitats, or potential roosting sites in the vicinity.

The survey was conducted during the summer period, when female bats typically congregate in maternity roosts for parturition and the rearing of young. The very high level of bat activity recorded during this period indicates that, with a high degree of likelihood, a substantial proportion of the roosts used within and around the Project Area function as maternity roosts.

The survey covers only a portion of the bat activity season, which should be taken into account when interpreting the results. Species composition and activity levels are likely to vary during spring and autumn periods.

Methodological limitations also influenced the outcomes. Automated identification produced errors, which were adjusted during manual species identification, and the variability and overlap of echolocation parameters complicate species-level identification. Nevertheless, most signals were assigned to species level with a sufficient degree of confidence.

Of particular note is the detection of the Eastern barbastelle (*Barbastella caspica*), a rare and declining species. Its inclusion in the forthcoming edition of the National Red Data Book of the Republic of Uzbekistan is currently under discussion.

5. CONCLUSION

Within the framework of the survey, bat roost searches were not conducted due to access and confidentiality restrictions during the surveys. However, the acoustic transect survey was conducted as planned and achieved its stated objectives. The survey results strongly indicate that bat roosts (including maternity roosts) are highly likely to be present within the Project Area and its surroundings.

The conducted survey confirmed the presence of a diverse bat community across the Project site. In total, six species from five genera were identified. The most abundant species was the Common pipistrelle (*Pipistrellus pipistrellus*), which accounted for approximately **96%** of all records and was detected at nearly all survey points. Other species, including the Serotine bat (*Eptesicus serotinus*), the Parti-coloured bat (*Vespertilio murinus*), David's myotis (*Myotis davidii*), Geoffroy's bat (*Myotis emarginatus*), and the Eastern barbastelle (*Barbastella caspica*), were recorded less frequently but nonetheless across multiple transects and habitat types.

Bats activity was very high activity across the Project Area and its surroundings. Bat calls were recorded at 111 out of 114 survey points, indicating widespread use of the Project Area. The distribution of detections, with higher activity around water objects and build structures suggests that the area provides important foraging grounds and roosting habitats. In addition, this area may serve as a transit corridor during seasonal movements.

In *Pipistrellus pipistrellus*, foraging areas are commonly located close to roosts, with an average maximum foraging distance of approximately 1.2-2 km (Davidson-Watts et al., 2005). This indicates that the majority of all recorded individuals are likely associated with roosting features, such as man-made structures and trees, located within a 1–2 km buffer zone of the survey points.

Pipistrellus pipistrellus typically roosts in narrow crevices and cavities, which are frequently inaccessible for visual inspection. This should be taken into account during the planning of mitigation measures.

No species listed in the Red Data Book of the Republic of Uzbekistan or in the IUCN Red List with a conservation status of NT or higher were detected.
